

**AMENDMENTS TO THE SPECIFICATION**

Kindly amend paragraph [0006] as follows:

[0006] One of the problems with color appearance models is that the models are typically based on standard color or spectral definitions, such as Munsell color chips, that do not suitably cover the gamut of color and ~~illuminance~~ illuminants for a particular application. For example, the colors and image characteristics of digital cameras can be very different from characteristics in other areas.
